Nuovi marcatori bioumorali nella diagnosi precoce di patologie asbesto correlate

Prof.ssa M. Comar
UCO Igiene e Medicina Preventiva
Università degli Studi di Trieste

'A biomarker is a characteristic that is objectively measured and evaluated as an indicator of normal biologic processes, pathogenic processes or pharmacological responses to a therapeutic intervention'

(National Institutes of Health's Biomarkers Definitions Working Group)

- La diagnosi precoce del Mesotelioma Maligno è estremamente difficile in quanto solo il 5% dei pazienti è diagnosticato nello stadio 1°A della malattia .

- È critica la necessità di individuare un sistema non invasivo ed efficace in grado di ridurre il ritardo diagnostico.

- Ad oggi non sono disponibili un marcatore o pannello di marcatori solubili standardizzati per una diagnosi certa di Mesotelioma.

Marcatori con ruolo diagnostico

- Hyaluronic acid
- Ca12
- Ca-15.3
- TPA
- Cyfra 21.1
- **OSTEOPONTIN (OPN) (low specificity)**
- **MEGAKARYOCYTES POTENTING FACTOR (MPF) (alternative to SM)**
- **FIBULIN-3 (2014-prognostic marker)**
- **MESOTHELIN (SM) (FDA-approved biomarker)**

Rilevanti solo nel contesto di associazione con l'outcome della malattia

Un marcatore ideale per il mesotelioma

- Diagnosi:

-individuare i diversi istiotipi tumorali

-differenziare il MPM da iperplasia mesoteliale e adenocarcinoma metastatico

- Definire il grado di progressione

- Monitoraggio del trattamento/ remissione

- Fattore prognostico in assenza di trattamento

- **Predizione della malattia nei soggetti esposti all'asbesto.**

PROTEINE INFIAMMATORIE NEL MM

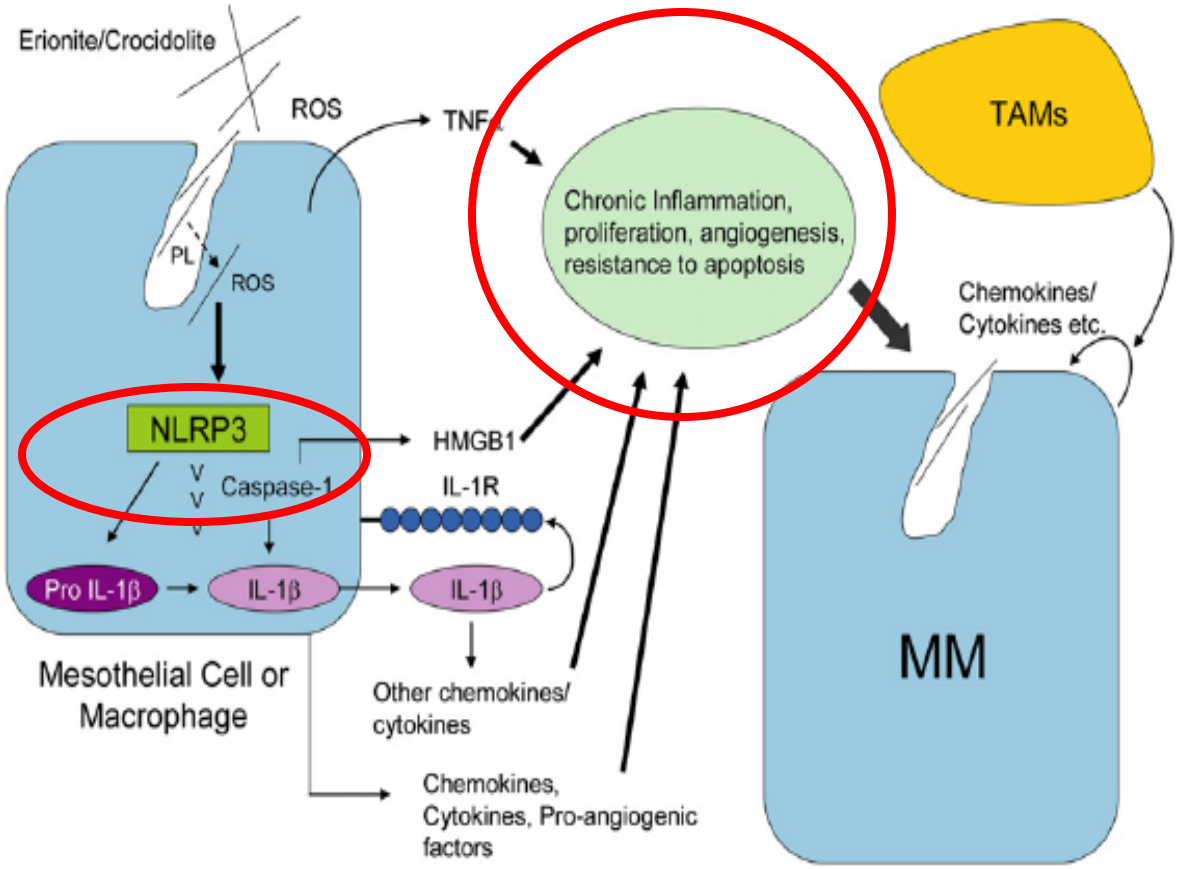

Figure 4 The NLRP3 (NAPL3) inflammasome is a key player in initiation of inflammation and release of chemokines and cytokines in human mesothelial cells and macrophages in response to long, pathogenic fibers. ROS appear to play a role in both activation of NADPH during phagocytosis and lysosomal degradation, which then releases asbestos fibers into the cytoplasm, where they interact with NLRP3 and induce caspase-1 activity. As a consequence, mature IL-1β, high-mobility group protein 1, and IL-1β–related cytokines are released into the tumor milieu, creating episodic bouts of cell injury, inflammation, and compensatory proliferation. Levels of these key inflammatory factors are reduced in mesothelial cells transfected with small-interfering NLRP3 and enhanced in the presence of TNF-α released by mesothelial cells, TAMs, and macrophages in the tumor environment.[49,67]

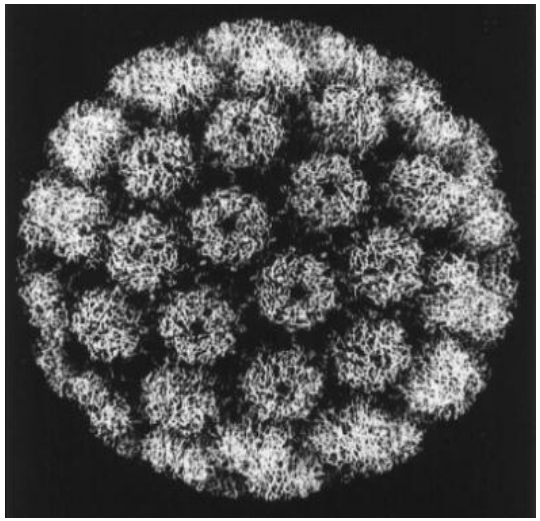
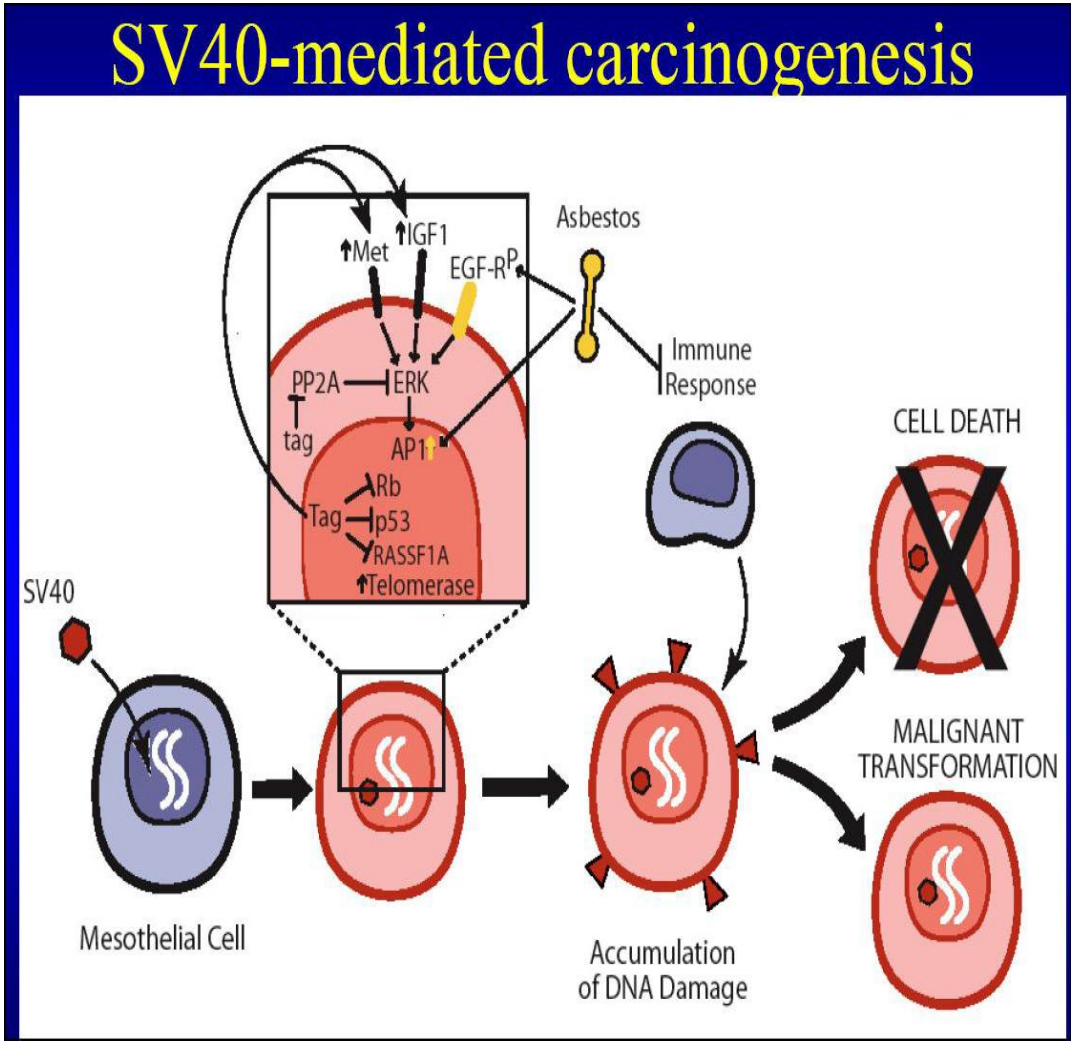
SV40





SV40 aumenta il rischio di mesotelioma fra individui esposti ad asbesto in quanto incrementa gli effetti carcinogenetici di quest'ultimo: la penetrazione delle fibre di asbesto nelle cellule mesoteliali infette da SV40, non genera apoptosi grazie all'azione del virus

High prevalence of serum antibodies reacting with simian virus 40 capsid protein mimotopes in patients affected by malignant pleural mesothelioma

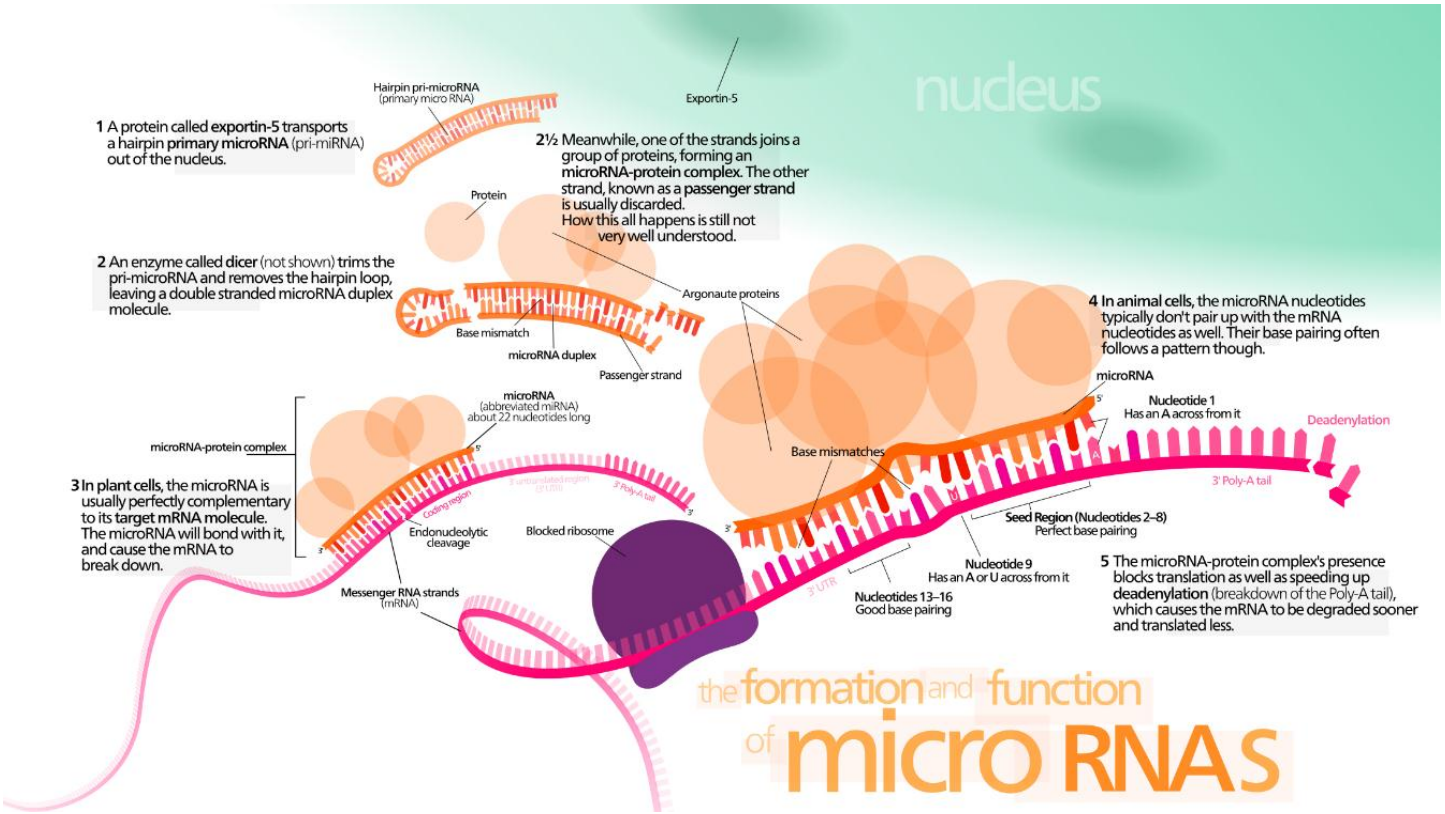
Micro RNA:



1. I **microRNA** (**miRNA)**, sono piccole molecole endogene di RNA non codificante, a singolo filamento.
2. 20-22 nucleotidi
3. I miRNA funzionano tramite accoppiamento-base con sequenze complementari delle molecole di mRNA
4. Il genoma umano codifica per più di 2000 miRNA.

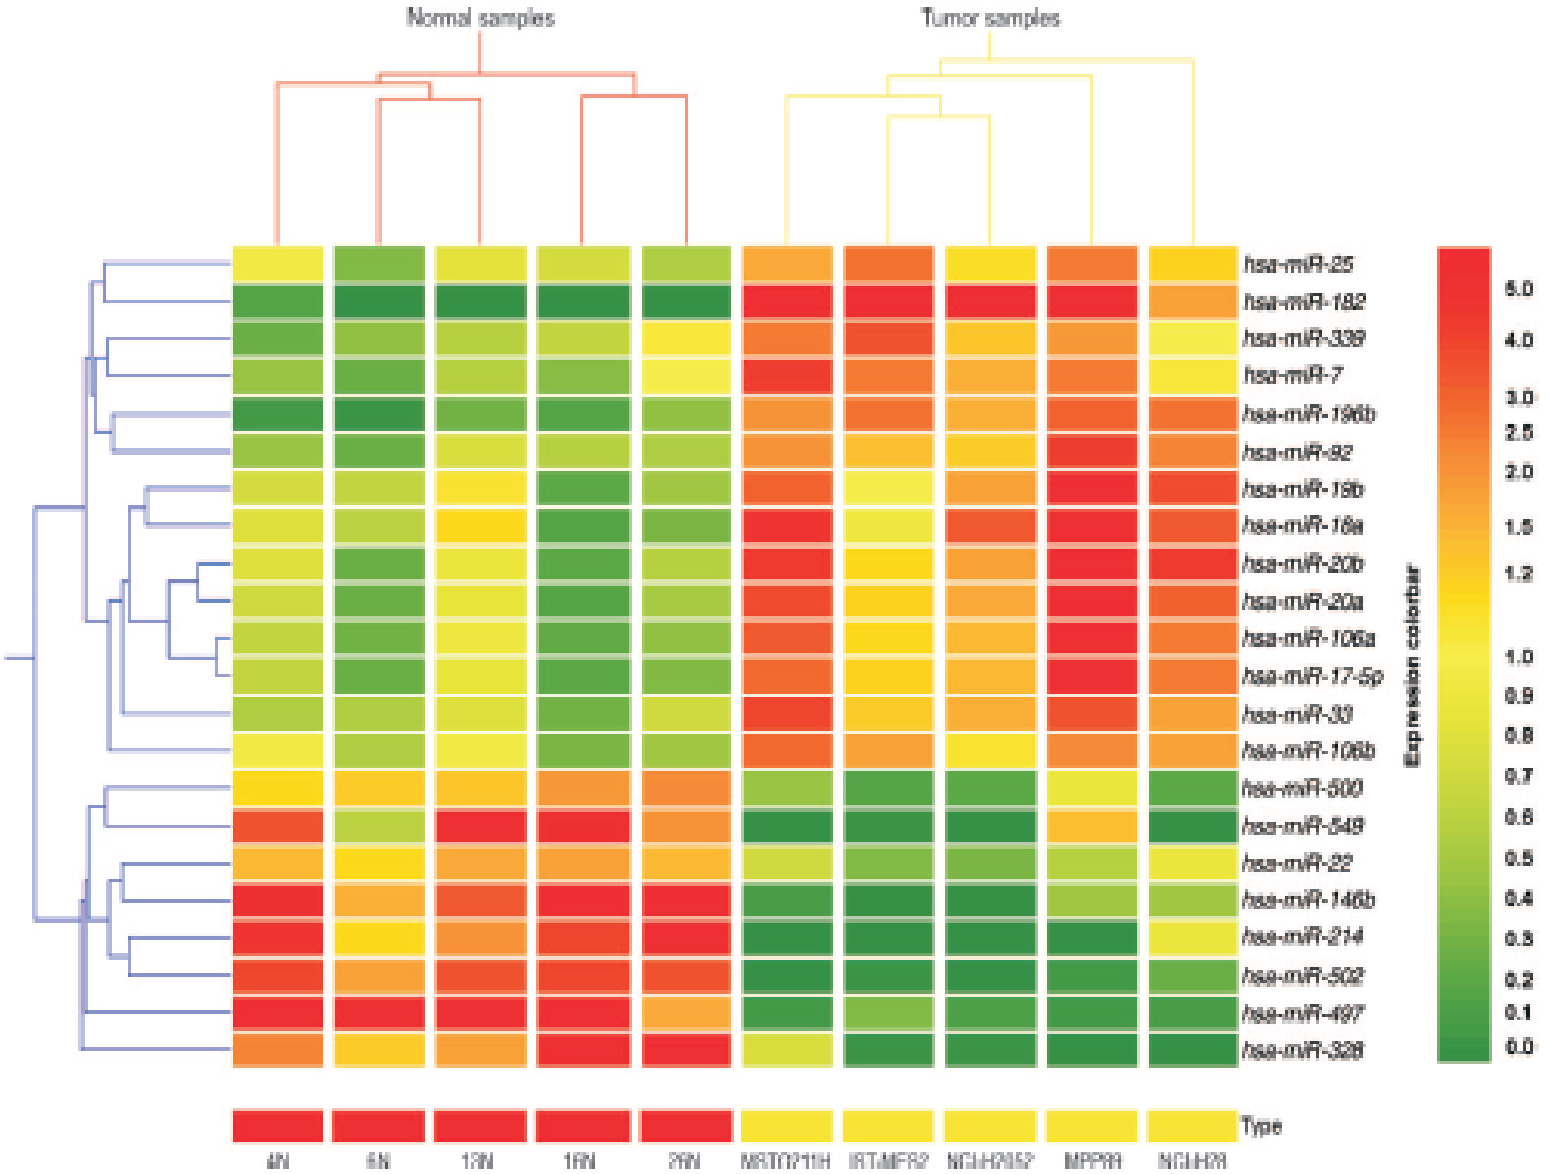


FIGURE 1. Cluster analysis of microRNA (miRNA) expression profiles in human normal pleural mesothelial short-term cell culture (HMC) and malignant pleura mesothelioma (MPM) cells. Cluster analysis obtained using the 22 miRNAs described in Table 1, which exhibit at least a twofold differential expression between MPM and HCM samples, and which a p value <0.05 was applied to. The red color represents normal samples, whereas yellow represents tumors.

Patogenesi: inalazione delle fibre

Il 70% delle fibre inalate viene eliminata (espettorato).
Il 30% attraversa l'epitelio alveolare penetrando nell' interstizio polmonare.

attivazione dei macrofagi alveolari

produzione di citochine

- deregolazioni di protooncogeni (PDGFb)
- conseguente crescita mesoteliale

Citochine come biomarcatori solubili per la patologia asbesto indotta ?
